

Diploma thesis focuses on air protection, especially on the issues of unlisted sources of air pollution according to the Czech Air Protection Act. It aims on small stationary sources of pollution that are subject to a softer regulation than huge polluters. Important group of small stationary sources are boilers used in homes to heat them up. In the case, that the operator of the sources does not fulfil his/her responsibilities according to the Air Protection Act, he/she can cause damage to the environment and endanger neighbours health. But because of the right of privacy it is not possible to control the source. The paper analysis the possibilities to resolve the dilemma between three constitutional rights – right of privacy against right to a favourable environment and right to the protection of health.
